Jet-clump interaction

INTRODUCTION

JETS FROM YSOS

- Jets are supersonic and collimated flows of matter and electromagnetic fields.
- They emante from the central protostar and are stopped at *d* ~ 1 - 10 pc as a consequence of the interaction with the external medium (i.e. the molecular cloud).
- Models based on a disc- (Blandford & Payne, 1982) and a X-wind (Shu et al. 1994) has been proposed to explain the formation of protostellar jets.
- These jets are detected at different wavelengths, from radio to X-rays.

INTRODUCTION

NON THERMAL EMISSION FROM YSOS JETS

- Non-thermal radio emission has been detected in a handfull of protostellar jets/HH objects.
- Most of them emanates from a massive protostar (e.g. HH 80-81, IRAS 16547-4247).
- Synchrotron radiation is produced by a population of relativistic electrons.
- These relativistics particles can produce also radiation at higher frecuencies.

Carrasco-Gonzalez et al. 2010

If particles have enough energy, γ -rays can be produced!

MODEL

MODEL ASSUMPTIONS

- Jet kintic luminosity: $L_j = \eta L_{\star} = 10^{36} \eta_{0.1} L_{\star,37}$ erg s⁻¹.
- Jet velocity: $v_j = 500 \text{ km s}^{-1}$.
- Jet density: $n_{j} = 17 L_{j,36} v_{j,500}^{-3} \theta_{10}^{-2} (z/pc)^{-2} cm^{-3}$.
- Jet magnetic field: $B_j = 0.4(z/pc)^{-1}$ mG ($U_B = 10^{-3}U_{kin}$).

Molecular cloud:

- Density: $n_{\rm mc} = 10^3 (r/{\rm pc})^{-3/2} \, {\rm cm}^{-3}$
- Temperature: $T_{\rm mc} = 20(r/{\rm pc})^{-0.5} \, {\rm K}$

(Rodriguez & Garay 1990).

• Magnetic field: $B_{\rm mc} = (r/{\rm pc})^{-1} \, {\rm mG}$

(Crutcher et al. 2011).

MODEL

Essential ingredient of the model: shocks

- Jet-medium interaction: a bow shock in the molecular cloud and a shock (Mach disc) in the jet are formed.
- The (homogeneous) jet impact with an inhomogeneity of the cloud, and a bow shock is formed around the inhomogeneity.
- Clumps ejected from the jet base with velocity v_c > v_j forms a bow shock in the jet.

MODEL

JET TERMINATION SHOCKS

JET TERMINATION SHOCKS

•
$$\chi_{\rm mc} = n_{\rm j}/n_{\rm mc}$$
.

•
$$v_{\rm bs} = v_{\rm j}/(1 + \sqrt{1/\chi_{\rm mc}}).$$

•
$$v_{\rm rs}|_{\rm bs} = v_{\rm j} - (3/4)v_{\rm bs}$$
.

• The bow shock is radiative (*I*_{th.cooling} < *R*_j).

(日) (日) (日) (日) (日) (日) (日)

Then, particles can be accelerated (via Fermi I) up to high energies in the reverse shock.

Hartigan 1988, Blondin et al. 1989, Güedel's talk

MODEL

JET TERMINATION SHOCKS

REVERSE SHOCK: PARTICLE ACCELERATION

•
$$L_{\rm nt} = \eta_{\rm nt} L_{\rm sh} \sim 10^{35} \left(\frac{\eta_{\rm nt}}{0.1}\right) \left(\frac{L_{\rm j}}{10^{36} {\rm erg \, s^{-1}}}\right) {\rm erg \, s^{-1}}.$$

Q_{e,p} ∝ E⁻²_{e,p}.
We solve the following equation in the jet shocked region:

$$\frac{\partial N_{e,p}}{\partial t} = \frac{\partial}{\partial E_{e,p}} (\dot{E}_{e,p} N_{e,p}) - \frac{N_{e,p}}{\tau_{\rm esc}} + Q_{e,p}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

MODEL

JET TERMINATION SHOCKS

REVERSE SHOCK: NON-THERMAL EMISSION

 Spectral energy distributions at z = 0.1 and 10 pc. Bolometric luminosities in the Fermi range: 0.1 -1 GeV.

MODEL

JET-CLUMP INTERACTION

JET-CLUMP INTERACTION

•
$$\chi_{\rm c} = n_{\rm c}/n_{\rm j}$$
.

•
$$v_{\rm bs} = v_{\rm c}/(1+1/\sqrt{\chi_{\rm c}}).$$

•
$$V_{\rm sc} = V_{\rm bs}/\sqrt{\chi_{\rm c}}$$
.

- The clump expands at the sound velocity: $dr/dt = C_s$.
- The clump is accelerated up to v_j by the force exerted by the jet: $M_c \frac{dv_c}{dt} = \pm \rho_j (v_{bs} \pm v_j)^2 \pi R_c^2$.
- The clump can be disrupted by RT and KH instabilities.

e.g. Klein et al. 1994, Pittard et al. 2010, Perucho & Bosch-Ramon 2012

MODEL

JET-CLUMP INTERACTION

CLUMP OF THE MOLECULAR CLOUD

Clump properties:

- $z_{int} = 0.1$ pc.
- $R_{\rm c} = R_{\rm j}/2, \ 0.1R_{\rm j}.$
- $n_{\rm c} = 10 n_{\rm mc} \rightarrow \chi_{\rm c} \sim 10.$
- $M_{\rm c} \sim 10^{-3}, \ 10^{-5} \ M_{\odot}.$
- $v_{\rm sc} \sim v_{\rm j}/\sqrt{\chi_c} \sim$ 200 km s⁻¹.
- $t_{\rm sc} \sim 10^9, \ 2 \times 10^8 \ {
 m s.}$
- $t_{\rm accel} > t_{\rm RT/KH} \gtrsim t_{\rm sc}$.
- Mixing between jet and ambient material.

After disruption, small bow shocks around the pieces can be formed, and particles can be also accelerated there.

MODEL

JET-CLUMP INTERACTION

CLUMP: PARTICLE ACCELERATION

•
$$L_{\text{nt}} = \eta_{\text{nt}} \left(\frac{R_c}{R_j}\right)^2 L_j \sim 10^{35} \left(\frac{R_c}{R_j}\right)^2 \left(\frac{\eta_{\text{nt}}}{0.1}\right) \left(\frac{L_j}{10^{36} \text{erg s}^{-1}}\right) \text{ erg s}^{-1}.$$

• $Q_{e,\rho} \propto E_{e,\rho}^{-2}.$

• We solve the following equation in the jet shocked region:

$$rac{\partial \textit{N}_{e,p}}{\partial t} = rac{\partial}{\partial \textit{E}_{e,p}}(\dot{\textit{E}}_{e,p}\textit{N}_{e,p}) - rac{\textit{N}_{e,p}}{ au_{
m esc}} + \textit{Q}_{e,p}.$$

 $E_e^{
m max}\sim 0.5, \ 1 \ {
m TeV}$ $E_p^{
m max}\sim 0.5, \ 2.4 \ {
m TeV} \ ({
m diffusion})_{
m even}$ is the second sec

MODEL

JET-CLUMP INTERACTION

CLUMP: NON-THERMAL EMISSION

- Relativistic Bremsstrahlung emission is detectable by Fermi.
- IC emission is detectable only in the case of large clumps.

() < ∃ >

3

CONCLUSIONS

SUMMARY AND CONCLUSIONS

- Synchrotron emission indicates the presence of relativistic electrons in jets from massive protostars.
- Electrons and protons can be accelerated in shocks produced by the jet interacting with the molecular cloud.
- If $v_j \gtrsim$ 500 km/s, these particles can reach enough energy to produce γ -rays.
- γ-ray emission from protostellar jets may be detected by the new generation of Cherenkov telescopes (e.g. CTA) and also by Fermi.
- There is an statistical correlation between some Fermi sources and massive protostars (Munar-Androver et al. 2011).

The detection of high-energy radiation open a new window to study the formation of massive stars, as well as the jet formation mechanism.

CONCLUSIONS

FUTURE WORK

- To model the "two component" jet: homogeneous + clumpy.
- To study the dynamics (instabilities/lifetime) of clumps into the jet.
- To consider synchrotron emission as seed photons to inverse Compton scattering.
- To apply the model to particular sources (e.g. HH 80-81).
