

CASA

Emmanuel Momjian (NRAO)

some slides from J. Ott

Atacama Large Millimeter/submillimeter Array

Expanded Very Large Array

Robert C. Byrd Green Bank Telescope

Very Long Baseline Array

CASA

- CASA is the offline data reduction package for ALMA and the EVLA (data from other telescopes usually work, too, but not primary goal of CASA).
- Import/export data, edit, calibrate, image, analyze.
- Also supports single dish (based on ATNF's ASAP).
- CASA has many tasks and a LOT of tools.

CASA

- Easy to write scripts and tasks.
- Lots of documentation, reduction tutorials, helpdesk.
- CASA has some of the most sophisticated algorithms implemented (multi-scale clean, Taylor term expansion for wide bands, W -term projection, OTF mosaicing, etc.)
- It has an active Algorithm Research Group.

CASA

- Web site: <http://casa.nrao.edu/>
- Available for both Linux and Mac OS.
- Two versions of CASA, *Release* and *Stable* can be downloaded.
 - The *Stable* version has more functionality but has not been as rigorously tested as the *Release*.
 - The available documentation is only for the *Release*, so *Stable* may behave somewhat differently than what is currently documented.
 - Make sure to subscribe to the CASA mailing list for announcements of new releases, workshops, etc... (casa-announce), or for critical bugs and code updates (casa-users) at: <http://casa.nrao.edu/> → Getting Help → Mailing lists

CASA

- Documentation is available at <http://casa.nrao.edu/> → 'Using CASA'
- Training material is available at <http://casaguides.nrao.edu>
- For help, use the NRAO help desk at: <http://help.nrao.edu>

Outline

- CASA startup
- CASA basic python interface
- Tasks and tools
- The Measurement Set
- Data selection syntax
- Visualization tools
- Make your own task!

CASA Startup

> casapy

CASA Version 3.3.0 (r16856)

Compiled on: Thu 2011/11/03 18:24:40 UTC

For help use the following commands:

tasklist - Task list organized by category

taskhelp - One line summary of available tasks

help taskname - Full help for task

toolhelp - One line summary of available tools

help par.parametername - Full help for parameter name

Single Dish sd* tasks are available after asap_init() is run

Activating auto-logging. Current session state plus future input saved.

Filename : ipython.log

Mode : backup

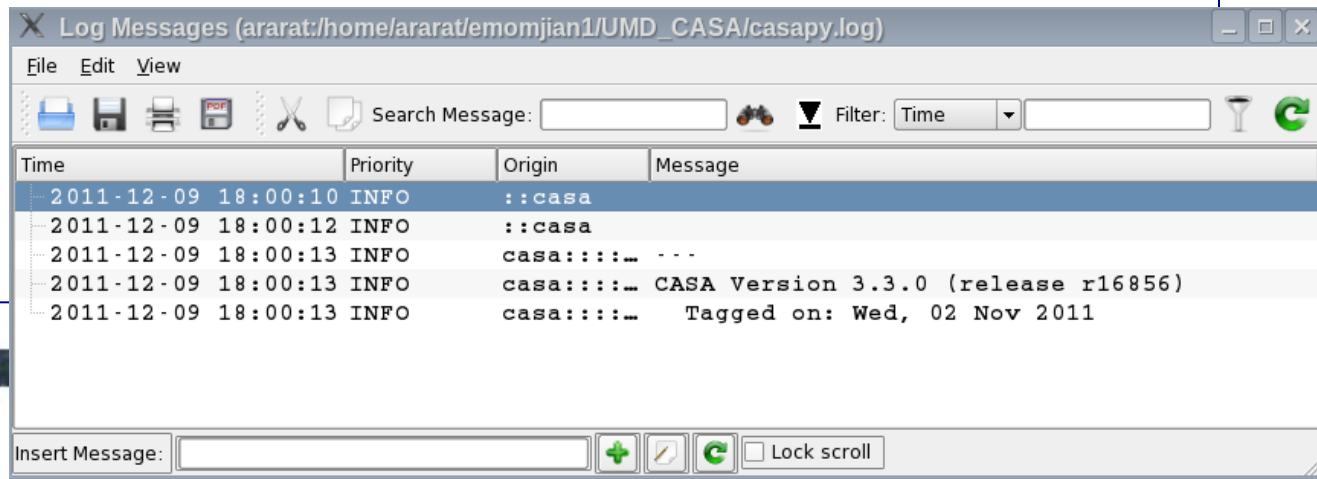

Output logging : False

Raw input log : False

Timestamping : False

State : active

- CASA <2>:

The screenshot shows a window titled "Log Messages (ararat:/home/ararat/emomjian1/UMD_CASA/casapy.log)". The window contains a table of log entries with columns for Time, Priority, Origin, and Message. The entries show the CASA startup sequence, including the version number and the date it was tagged.

Time	Priority	Origin	Message
2011-12-09 18:00:10	INFO	::casa	
2011-12-09 18:00:12	INFO	::casa	
2011-12-09 18:00:13	INFO	casa:::...	---
2011-12-09 18:00:13	INFO	casa:::...	CASA Version 3.3.0 (release r16856)
2011-12-09 18:00:13	INFO	casa:::...	Tagged on: Wed, 02 Nov 2011

CASA Interface

- Uses IPython for its command line interface:
 - Filesystem navigation, shell access
 - Autoparenthesis
 - Namespace completion (<TAB>)
 - Session logging
 - `ipython.log` – ipython command history
 - `casapy.log` – casa messages
 - Numbered input/output with command history, full searching

Python Pointers

- to run a .py script:

```
execfile('<scriptname>')
```

example: `execfile('ngc5921_demo.py')`

- indentation matters!
 - be careful when doing cut-and-paste to Python
 - cut a few (4-6) lines at a time
- Python counts from 0 to n-1!
- variables are global when using *task interface*
- Task names are objects (not variables)

Tasks and tools in CASA

- **Tasks** - high-level functionality, well defined purpose
 - function call or parameter handling interface
 - these are what you should use in tutorial
- **Tools** - complete functionality
 - **tool.method** calls, used by tasks
 - sometimes shown in tutorial scripts
- Shell commands can be run with a leading exclamation mark **!du -hs**

CASA

- All CASA tasks can be listed by *tasklist*.
- The tasks are grouped as:
 - Import/export
 - Information
 - Editing
 - Manipulation
 - Calibration
 - Modeling
 - Imaging
 - Analysis
 - Visualization
 - Simulation
 - Single dish
 - Utility
- AIPS – CASA dictionary is available at <https://safe.nrao.edu/wiki/bin/view/Software/CASA-AIPSDictionary>
- (Historic) MIRIAD-CASA and CLIC-CASA dictionaries are available in the CASA cookbook.

Tasks

To list the tasks: *tasklist*

```
-----> tasklist()
Available tasks, organized by category (experimental tasks in parens ()
  deprecated tasks in curly brackets {}).
  Single Dish sd* tasks are available after asap_init() is run.
```

Tasks

To see list of tasks with short help:
taskhelp

```
CASA <4>: taskhelp
-----> taskhelp()
Available tasks:

accum          : Accumulate incremental calibration solutions into a calibration table
applycal      : Apply calibrations solutions(s) to data
autoclean     : CLEAN an image with automatically-chosen clean regions.
bandpass      : Calculates a bandpass calibration solution
blcal         : Calculate a baseline-based calibration solution (gain or bandpass)
boxit         : Box regions in image above given threshold value.
browseable    : Browse a table (MS, calibration table, image)
calstat       : Displays statistical information on a calibration table
clean         : Invert and deconvolve images with selected algorithm
clearcal      : Re-initializes the calibration for a visibility data set
clearplot     : Clear the matplotlib plotter and all layers
clearstat     : Clear all autolock locks
concat        : Concatenate several visibility data sets.
conjugatevis  : Change the sign of the phases in all visibility columns.
csvclean      : This task does an invert of the visibilities and deconvolve in the image plane.
cvel         : regrid an MS to a new spectral window / channel structure or frame
deconvolve    : Image based deconvolver
exportasdm    : Convert a CASA visibility file (MS) into an ALMA Science Data Model
exportfits    : Convert a CASA image to a FITS file
exportuvfits  : Convert a CASA visibility data set to a UVFITS file:
feather       : Combine two images using their Fourier transforms
find          : Find string in tasks, task names, parameter names:
fixplanets    : Changes FIELD and SOURCE table entries based on user given direction or POINTING table, optionally fixes the UVW coordinates
fixvis        : Recalculates (u, v, w) and/or changes Phase Center
flagautocorr  : Flag autocorrelations
flagcmd       : Flagging task based on flagging commands
flagdata      : All purpose flagging task based on selections
flagdata2     : All purpose flagging task based on selections. It allows the combination of several modes.
flagmanager   : Enable list, save, restore, delete and rename flag version files.
fluxscale     : Bootstrap the flux density scale from standard calibrators
ft            : Insert a source model into the MODEL DATA column of a visibility set:
```

Task Interface

- parameters are set as global Python variables

(set) <param> = <value>

(e.g. , vis = 'ngc5921.demo.ms')

- using inp, default, saveinputs, tget, tput
- execute

<taskname> or go

Task Interface

Call a task by

>inp <taskname>

if default values are desired, first type

>default <taskname>, followed by inp

```
CASA <9>: inp
-----> inp()
# gaincal :: Determine temporal gains from calibrator observations
vis                =      ''      # Name of input visibility file
caltable           =      ''      # Name of output gain calibration table
field              =      ''      # Select field using field id(s) or field name(s)
spw                =      ''      # Select spectral window/channels
intent            =      ''      # Select observing intent
selectdata       =      False     # Other data selection parameters
solint             =      'inf'    # Solution interval: egs. 'inf', '60s' (see help)
combine           =      ''      # Data axes which to combine for solve (scan, spw, and/or field)
preavg            =      -1.0     # Pre-averaging interval (sec) (rarely needed)
refant            =      ''      # Reference antenna name(s)
minblperant       =      4        # Minimum baselines _per antenna_ required for solve
minsnr            =      3.0      # Reject solutions below this SNR
solnorm           =      False    # Normalize average solution amplitudes to 1.0 (G, T only)
gainstype       =      'G'       # Type of gain solution (G,T,GSPLINE,K,KCROSS)
smodel            =      []       # Point source Stokes parameters for source model.
calmode           =      'ap'     # Type of solution: ('ap', 'p', 'a')
append            =      False    # Append solutions to the (existing) table
gaintable         =      ['']     # Gain calibration table(s) to apply on the fly
gainfield         =      ['']     # Select a subset of calibrators from gaintable(s)
interp           =      ['']     # Temporal interpolation for each gaintable (=linear)
spwmap            =      []       # Spectral windows combinations to form for gaintables(s)
gaincurve         =      False    # Apply internal VLA antenna gain curve correction
opacity           =      []       # Opacity correction to apply (nepers), per spw
parang            =      False    # Apply parallactic angle correction on the fly
async             =      False    # If true the taskname must be started using gaincal(...)
```

Task Interface

Some parameters are expandable, e.g., selectdata

```
CASA <11>: selectdata =true

CASA <12>: inp
-----> inp()

# gaincal :: Determine temporal gains from calibrator observations
vis = '' # Name of input visibility file
caltable = '' # Name of output gain calibration table
field = '' # Select field using field id(s) or field name(s)
spw = '' # Select spectral window/channels
intent = '' # Select observing intent
selectdata = True # Other data selection parameters
  timerange = '' # Select data based on time range
  uvrange = '' # Select data within uvrange (default units meters)
  antenna = '' # Select data based on antenna/baseline
  scan = '' # Scan number range
  observation = '' # Select by observation ID(s)
  msselect = '' # Optional complex data selection (ignore for now)

solint = 'inf' # Solution interval: egs. 'inf', '60s' (see help)
combine = '' # Data axes which to combine for solve (scan, spw, and/or field)
preavg = -1.0 # Pre-averaging interval (sec) (rarely needed)
refant = '' # Reference antenna name(s)
minblperant = 4 # Minimum baselines_per antenna_required for solve
minsnr = 3.0 # Reject solutions below this SNR
solnorm = False # Normalize average solution amplitudes to 1.0 (G, T only)
gaintype = 'G' # Type of gain solution (G,T,GSPLINE,K,KCROSS)
smodel = [] # Point source Stokes parameters for source model.
calmode = 'ap' # Type of solution: ('ap', 'p', 'a')
append = False # Append solutions to the (existing) table
gaintable = [''] # Gain calibration table(s) to apply on the fly
gainfield = [''] # Select a subset of calibrators from gaintable(s)
interp = [''] # Temporal interpolation for each gaintable (=linear)
spwmap = [] # Spectral windows combinations to form for gaintables(s)
gaincurve = False # Apply internal VLA antenna gain curve correction
opacity = [] # Opacity correction to apply (nepers), per spw
parang = False # Apply parallactic angle correction on the fly
asyncl = False # If true the taskname must be started using gaincal( )
```

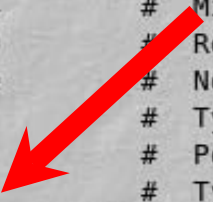

Task Execution

- Two ways to invoke:
 - call from Python as functions with arguments
`taskname(arg1=val1, arg2=val2, ...)`, like
`clean(vis='input.ms',
imasename='galaxy',selectvis=T,robust=0.5,
imsize=[200,200])`
unspecified parameters will be defaulted
 - use standard tasking interface
 - see Chapter 1.3 in Cookbook

Parameter Checking

```
CASA <19>: inp
-----> inp()
# gaincal :: Determine temporal gains from calibrator observations
vis                =      ''          # Name of input visibility file
caltable           =      ''          # Name of output gain calibration table
field              =      ''          # Select field using field id(s) or field name(s)
spw                =      ''          # Select spectral window/channels
intent             =      ''          # Select observing intent
selectdata         =      False       # Other data selection parameters
solint             =      'inf'       # Solution interval (sec) ('inf', '60s' (see help))
combine            =      ''          # Data combination line for solve (scan, spw, and/or field)
preavg             =      -1.0        # Pre-averaging (sec) (rarely needed)
refant             =      ''          # Reference antennas
minblperant        =      4           # Minimum baselines _per antenna_ required for solve
minsnr             =      3.0         # Reject solutions below this SNR
solnorm            =      False       # Normalize average solution amplitudes to 1.0 (G, T only)
gaintype           =      'G'         # Type of gain solution (G,T,GSPLINE,K,KCROSS)
smodel             =      []          # Point source Stokes parameters for source model.
calmode            =      'noidea'    # Type of solution: ('ap', 'p', 'a')
append             =      False       # Append solutions to the (existing) table
gaintable          =      ['']        # Gain calibration table(s) to apply on the fly
gainfield          =      ['']        # Select a subset of calibrators from gaintable(s)
interp             =      ['']        # Temporal interpolation for each gaintable (=linear)
spwmap             =      []          # Spectral windows combinations to form for gaintables(s)
gaincurve          =      False       # Apply internal VLA antenna gain curve correction
opacity            =      []          # Opacity correction to apply (nepers), per spw
parang             =      False       # Apply parallactic angle correction on the fly
async              =      False       # If true the taskname must be started using gaincal(...)
```

erroneous values in red

Help on Tasks

In-line help for all tasks (help <taskname>)

>help gaincal

Help on **gaincal** task:

Determine temporal gains from calibrator observations

The complex gains for each antenna/spwid are determined from the data column (raw data) divided by the model column. The gains can be obtained for a specified solution interval, spw combination and field combination. The GSPLINE spline (smooth) option is still under development.

Previous calibrations (egs, bandpass, opacity, parallactic angle) can be applied on the fly. At present with dual-polarized data, both polarizations must be unflagged for any solution to be obtained.

Keyword arguments:

vis -- Name of input visibility file

default: none; example: vis='ngc5921.ms'

caltable -- Name of output gain calibration table

default: none; example: caltable='ngc5921.gcal'

--- Data Selection (see help par.selectdata for more detailed information)

field -- Select field using field id(s) or field name(s).

['go listobs' to obtain the list id's or names]

default: ''=all fields

If field string is a non-negative integer, it is assumed a field index, otherwise, it is assumed a field name

field='0~2'; field ids 0,1,2

field='0,4,5~7'; field ids 0,4,5,6,7

field='3C286,3C295'; field named 3C286 and 3C295

field = '3,4C*'; field id 3, all names starting with 4C

DON'T FORGET TO INCLUDE THE FLUX DENSITY CALIBRATOR IF YOU HAVE ONE

Tools in CASA

🌐 What if there's no task?

→ use CASA tools (tasks are built upon tools)

🌐 tools are functions/methods

🌐 call from casapy as `<tool>.<method>()`

🌐 default tool objects are pre-constructed

🌐 e.g. imager (im) , calibrator (cb), ms (ms) , etc.
(see toolhelp)

CASA Tool List

To list the default tools:

>toolhelp

~ 1000 tools available

Available tools:

```
at : Juan Pardo ATM library
cb : Calibration utilities
cp : Cal solution plotting utilities
cs : Coordinate system utilities
fg : Flagging/Flag management utilities
ia : Image analysis utilities
im : Imaging utilities
me : Measures utilities
ms : MeasurementSet (MS) utilities
mp : MS plotting (data (amp/phase) versus other quantities)
pm : PlotMS utilities
rg : Region manipulation utilities
tb : Table utilities (selection, extraction, etc)
tp : Table plotting utilities
qa : Quanta utilities
sl : Spectral line import and search
sm : Simulation utilities
vp : Voltage pattern/primary beam utilities
---
pl : pylab functions (e.g., pl.title, etc)
sd : (after running asap_init()) Single dish utilities
```

Tools are described in the **CASA Toolkit Reference**:

<http://casa.nrao.edu/docs/CasaRef/CasaRef.html>

The Measurement Set

- The MS is a directory on disk, it consists of a MAIN table and sub-tables.
 - The MAIN table contains the visibility data. It consists of the `table.*` files.
 - The sub-tables (e.g. FIELD, SOURCE, ANTENNA, etc.) contain auxiliary and secondary information.
 - The sub-tables are sub-directories.
- To copy: must use `cp -rf` to get contents
- Best to remove MS with `rmtables('filename')`

Example MS

```
CASA <31>: ls day2_TDEM0003_20s_full/  
ANTENNA/          STATE/          table.f18_TSM1  table.f25_TSM1  
DATA_DESCRIPTION/ table.dat       table.f19        table.f3  
FEED/            table.f1        table.f2         table.f4  
FIELD/           table.f10       table.f20        table.f5  
FLAG_CMD/        table.f11       table.f21        table.f6  
HISTORY/         table.f12       table.f21_TSM0   table.f7  
OBSERVATION/     table.f13       table.f22        table.f8  
POINTING/        table.f14       table.f22_TSM1   table.f9  
POLARIZATION/    table.f15       table.f23        table.info  
PROCESSOR/       table.f16       table.f23_TSM1   table.lock  
SORTED_TABLE/    table.f17       table.f24        WEATHER/  
SOURCE/          table.f17_TSM1  table.f24_TSM1  
SPECTRAL_WINDOW/ table.f18        table.f25
```

```
CASA <32>: ls day2_TDEM0003_20s_full/ANTENNA/  
table.dat  table.f0  table.info  table.lock
```

Data Selection Syntax

- See Chapter 2.5 of Cookbook
 - field - string with source name or field ID
 - can use '*' as wildcard, first checks for name, then ID
 - example: field = '1331+305' ; field = '3C*' ; field = '0,1,4~5'
 - spw - string with spectral window ID plus channels
 - use ':' as separator of spw from optional channelization
 - use '^' as separator of channels from step
 - example: spw = '0~2' ; spw = '1:10~30' ; spw = '2~5:5~54^5'

Selection Syntax

- see Chapter 2.5 of Cookbook
 - antenna - string with antenna name or ID
 - first check for name, then pad name, then ID
 - example: antenna = '1~5,11' ; antenna = 'ea*', '!ea01'
 - For a baseline, use: antenna = 'ea01&ea10'
 - timerange - string with date/time range
 - specify 'T0~T1', missing parts of T1 default to T0.
 - example: timerange = '2007/10/16/01:00:00~06:30:00'
 - If year, month, day are not specified → defaults to 1st day in the data set.

Calibration

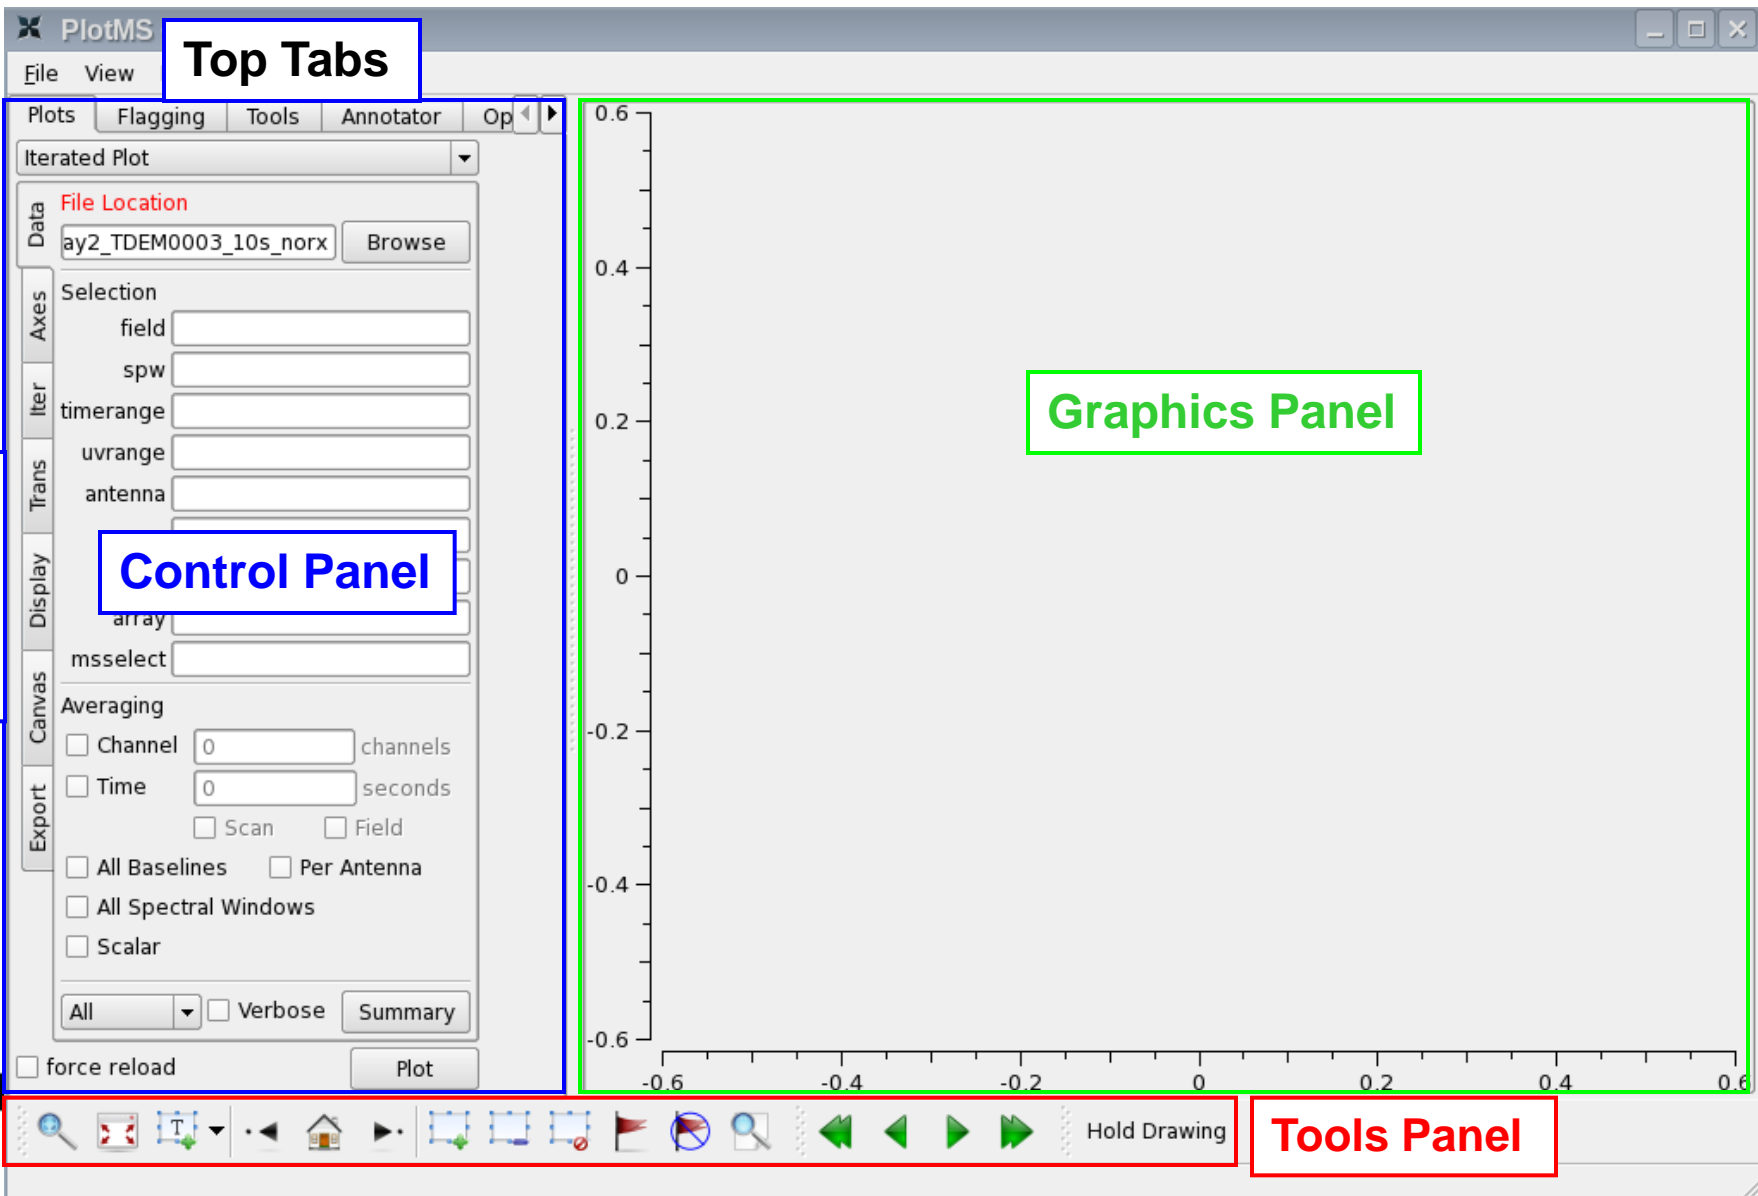

- Data structure: 3 columns (scratch columns):
- DATA column: raw data
- MODEL column: source model, e.g. extended flux calibrators, selfcal model
- CORRECTED_DATA: calibrated data
- Columns are created when needed, this may take some time (it triples the size of your data set)
- Calibration is with calibration tables, e.g. bandpass, gain, pol, antenna offset, etc.

Visualization Tools

- Visibilities: plotms, msview
- Images: viewer, imview
- Calibration tables: plotcal (or plotms)
- Any table values: browsetable
- Single dish: sdplot
- Plot anything: use python's matplotlib

Data Review: *plotms* (unix command line *casaplotms*)

Tool panel

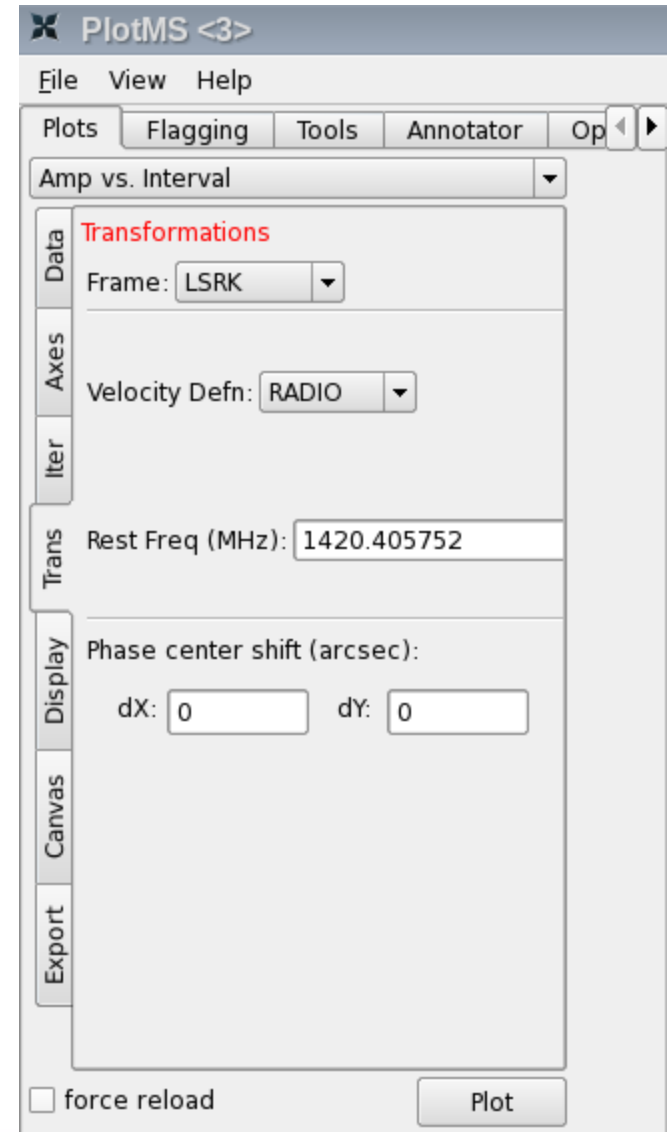

A screenshot of the PlotMS software interface. The title bar reads "PlotMS <3>". The menu bar includes "File", "View", and "Help". Below the menu bar are tabs for "Plots", "Flagging", "Tools", "Annotator", and "Op". The main window title is "Amp vs. Interval". On the left side, there is a vertical toolbar with tabs for "Data", "Axes", "Iter", "Trans", "Display", "Canvas", and "Export". The "Data" tab is active, showing "Axis of Iteration" set to "None". Below this are "Vertical Scale" and "Horizontal Scale" sections, each with "Global" (selected) and "Self" radio buttons. At the bottom of the "Data" tab are "Rows" and "Columns" spinners, both set to "1". At the very bottom of the interface, there is a "force reload" checkbox and a "Plot" button.

Transformations

Frame: TOPO, GEO, BARY, LSRK, LSRD, etc..

The screenshot shows the PlotMS software interface. The title bar reads "PlotMS <3>". The menu bar includes "File", "View", and "Help". Below the menu bar are tabs for "Plots", "Flagging", "Tools", "Annotator", and "Op". The main window title is "Amp vs. Interval". On the left side, there is a vertical toolbar with buttons for "Data", "Axes", "Iter", "Trans", "Display", "Canvas", and "Export". The "Data" button is selected, and the "Transformations" panel is active. This panel contains the following controls:

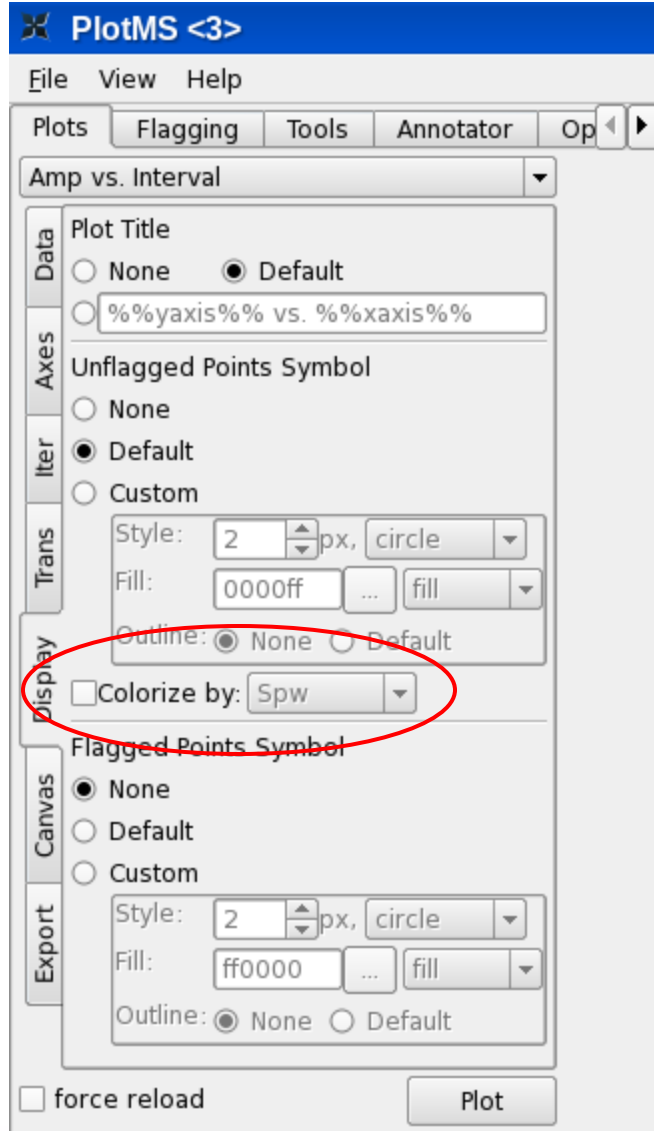

- Frame:** A dropdown menu set to "LSRK".
- Velocity Defn:** A dropdown menu set to "RADIO".
- Rest Freq (MHz):** A text input field containing "1420.405752".
- Phase center shift (arcsec):** Two text input fields, "dX:" and "dY:", both containing "0".

At the bottom of the panel, there is a checkbox labeled "force reload" which is unchecked, and a "Plot" button.

Flagging (or unflagging) Data

A few important notes

1. Data in CASA are either flagged or not flagged.
 - Every MS has a flag column.
 - Every bit of data has its own flag (set either to true or false).
 - Applying flags means setting the flag column entries of the selected bits of data to true.
2. Most flagging tasks have the option of creating a flag backup.
3. A flag backup is a MS that contains the state of the flags before running a flagging task.
4. Using *flagmanager*, backed-up flags can be restored.

Buildmytasks

- Using Python, you can write your own scripts!
- Such scripts can be converted to tasks.
- If you wish, you can share them with the community (e.g., through NRAO).
- Contributed scripts are currently available at:
<http://casaguides.nrao.edu/> → Data Reduction Guides → EVLA Guides → Contributed Scripts

Let's Use CASA!
