

Studying the Origins of Stars and their Planetary Systems with ALMA & VLA

14th Synthesis Imaging Workshop

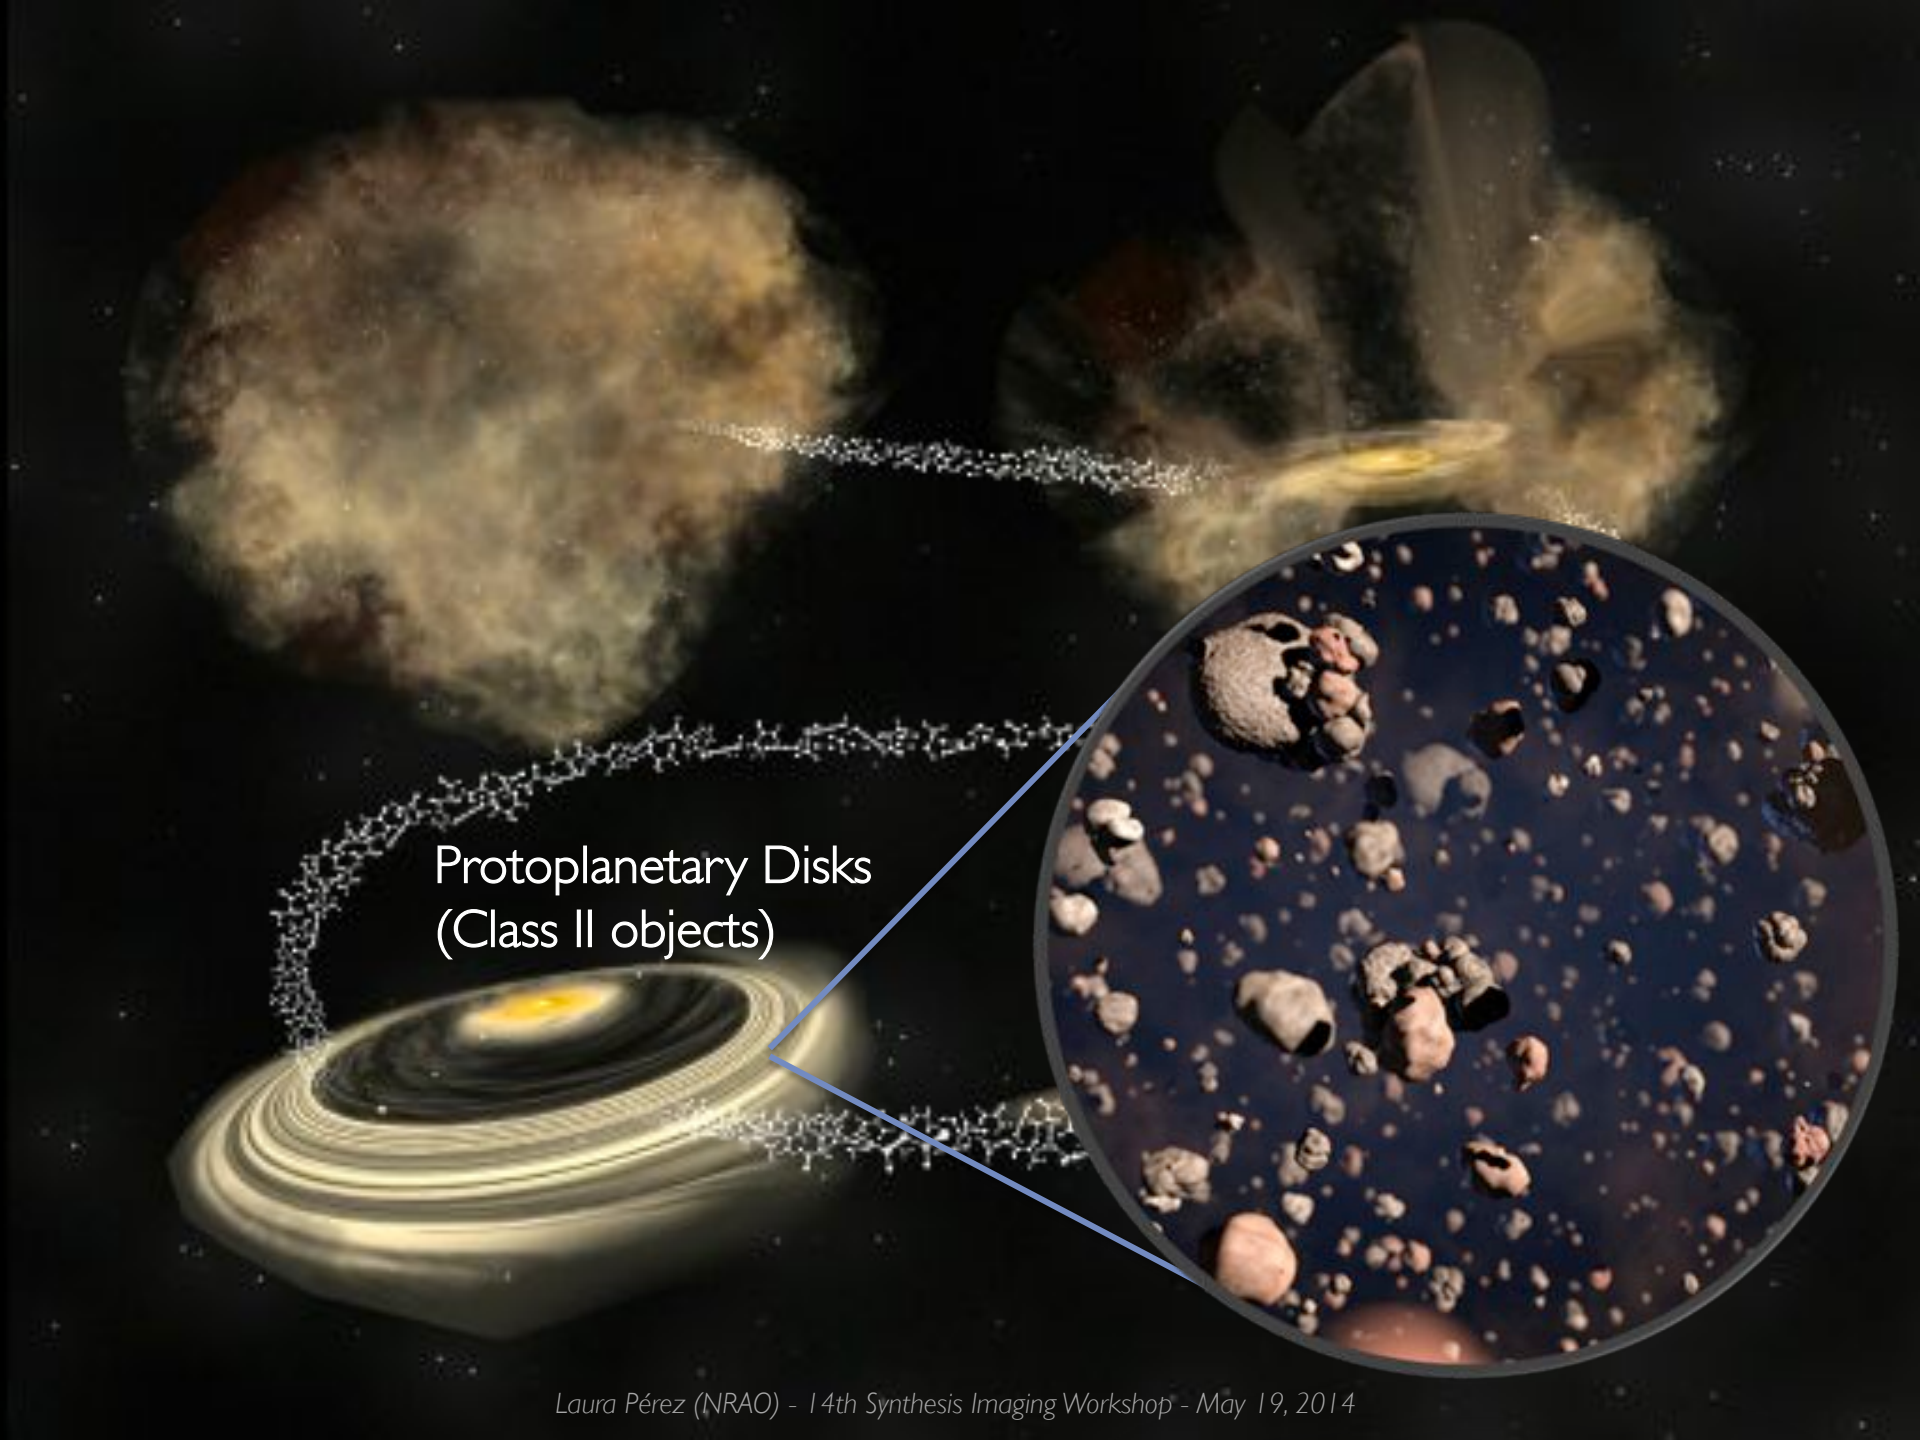

Laura Pérez

Jansky Fellow, National Radio Astronomy Observatory

Collaborators:

Claire Chandler (NRAO), John Carpenter (Caltech), Andrea Isella (Caltech),
Anneila Sargent (Caltech), Disks@EVLA Collaboration

The image illustrates the stages of star and planet formation. At the top left, a large, diffuse molecular cloud is shown. A filament of gas and dust extends from it towards the right. In the center, a protostar is forming, surrounded by a glowing, flattened protoplanetary disk. A circular inset on the right provides a magnified view of the disk's surface, showing a dense field of dust grains and small, irregularly shaped planetesimals. The entire scene is set against the black background of space.

ALMA Cycle 0 observations

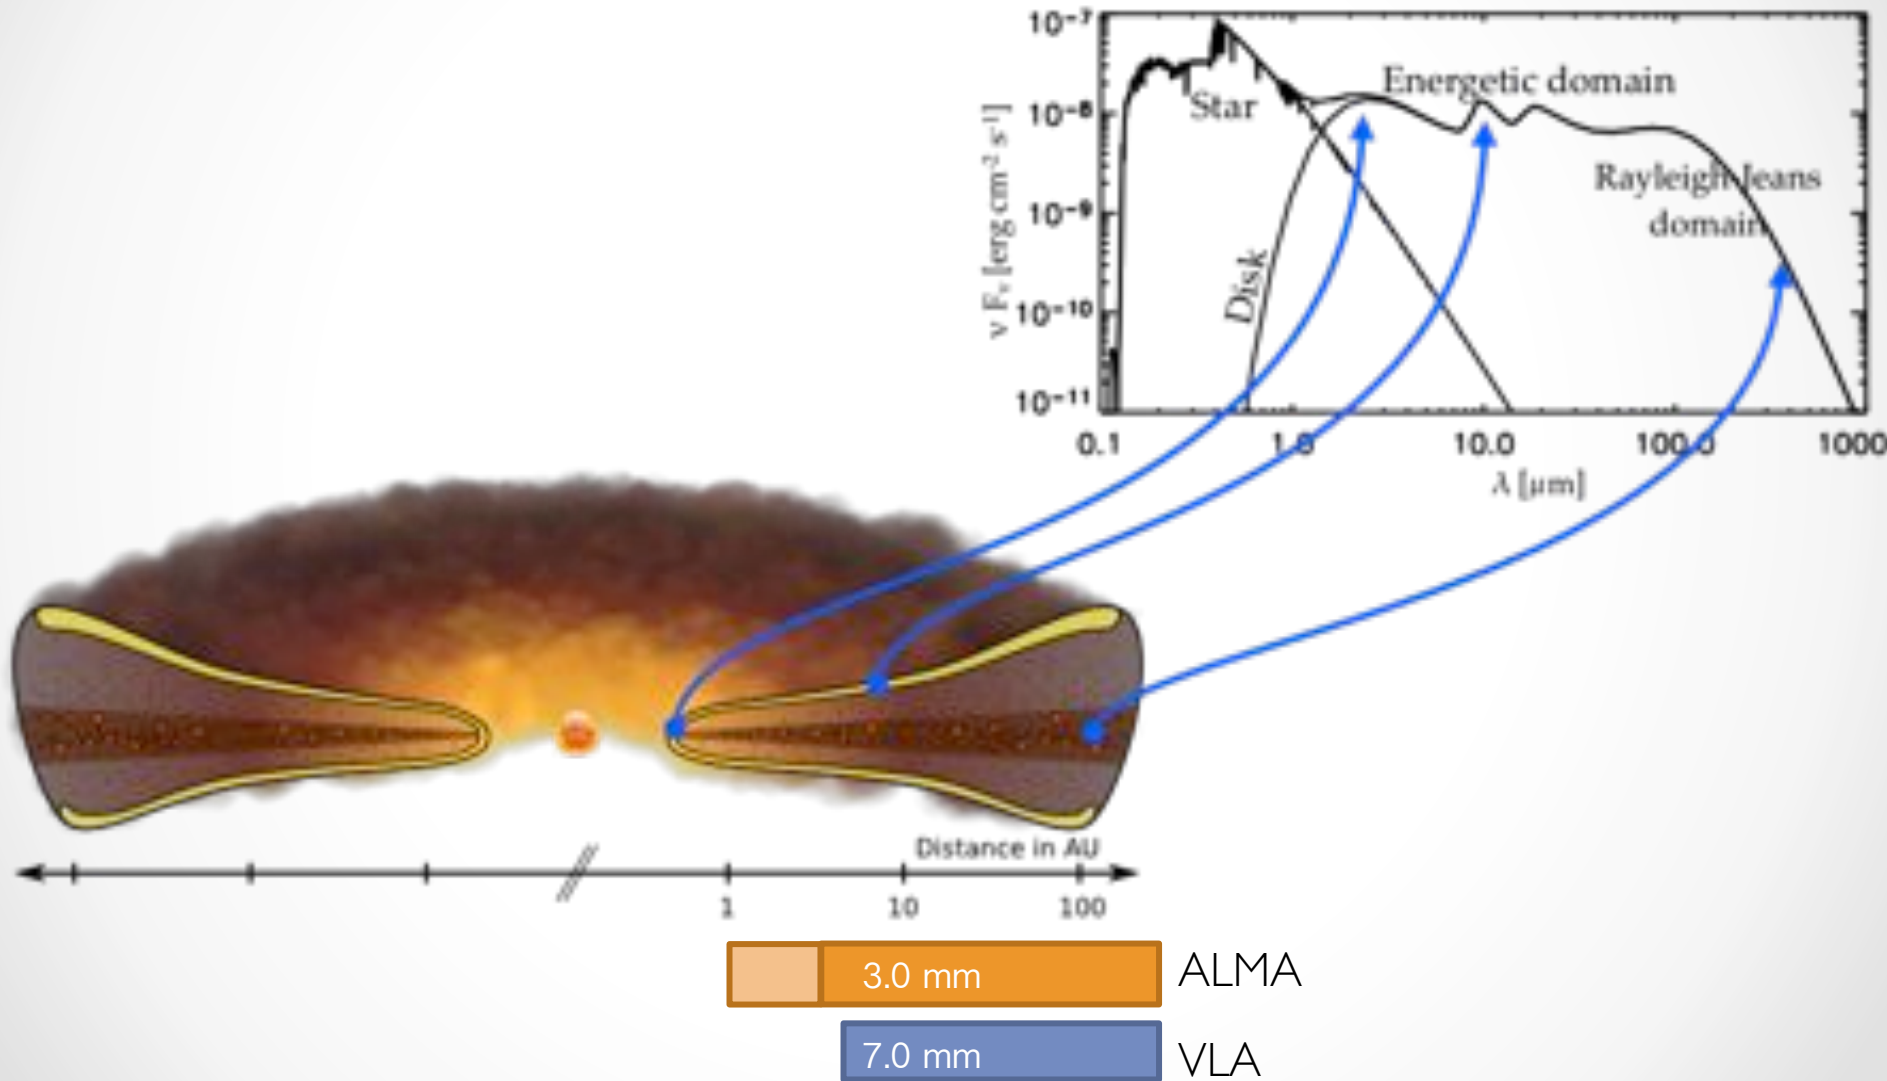

Observing Protoplanetary Disks at Radio-wavelengths

Different wavelengths probe different regions

Full extent of disk is better probed at millimeter/centimeter wavelengths

Different wavelengths probe different regions

Direct observations of solids require mm/cm observations

Emissivity spectral index β : a proxy for grain size

When dust population reaches large a_{max} , dust emission spectrum becomes shallow

Testi et al. (2014)

What do observations tell us about grain growth in protoplanetary disks?

Multi-wavelength observations constrain $\beta_{\text{disks}} < 1$

These observations imply growth from ISM sizes (μm) to pebble sizes (cm)

$$\Delta\beta = \frac{1}{\log_{10}(\nu_1/\nu_2) \ln 10} \left[\frac{1}{(\text{SNR}_{\nu_1})^2} + \frac{1}{(\text{SNR}_{\nu_2})^2} \right]^{0.5}$$

Disk@EVLA: Measuring dust size vs. orbital radius

Going to longer wavelengths is important to constrain β (R)

PI: Claire Chandler(NRAO)

- Determine prevalence of grain growth to cm-sized particles
 - 66 stars (ages ~ 1 -10 Myr old)
 - Bright and in nearby star-forming regions ($d \sim 140$ pc)
 - Photometry (between 7mm - 6cm)
 - global β
- Determine the location of large grains in disks
 - Sub-sample imaged with $\sim 0.04''$ resolution
 - At 7mm/1 cm, and at 6cm

Disk@EVLA: Measuring dust size vs. orbital radius

7 mm/1 cm observations with the VLA

exoplanet?

Kraus & Ireland (2012)

Isella et al. +LP (2014)

Studying circum**planetary** disks

Summary

- Compelling evidence that **grain growth** takes place in disks
 - Radial drift of solids hinders further dust growth
 - A way to overcome this problem: **dust trapping** of large particles
 - Dust traps may occur radially in “rings”, azimuthally in “vortices”
- *These predictions are currently being **tested** with ALMA & VLA!*
